Serial verb constructions in Ede (Rhade)

Abstract:

Ede (also called Rade, Rhade, Rhode), a language of the Chamic branch of Malayo-Polynesian, is spoken mainly in Daklak and other provinces in the Southern plateau region of Vietnam. The paper discusses two types of serial verb constructions (henceforth SVCs) in Ede in terms of their relative degree of integration.

The main property of the first type of SVCs in Ede is equal verbal status. In other words, each verb in the first type is equal in contributing lexical and syntactic content to the construction. There are two SVCs in the first type in Ede: nuclear SVC and core SVC. A nuclear SVC and a core SVC, as follow Foley and Olson’s definition (1985), are constructions containing a sequence of verbs sharing the same tense, aspect, mood and modality, and act as a single predicate without overtly marking morphemes of coordination or subordination. The difference between Ede nuclear SVC and core SVC is the fact that the former has all sequential verbs sharing the same arguments while the other doesn’t. All verbs in core SVCs may have different arguments. This difference also shows a degree of integration of two constructions: nuclear SVC in Ede is more integrated than core SVC. The following examples will show nuclear SVC (ex.1) and core SVC in Ede (ex.2).

(1) Da mnuih hiu duah huâk mà kan hông kngan.  
PL people go look-for feel-around catch fish with hand  
‘Many people go to look for, feel around and catch fish by hand.’

(2) Phung buôn sang nao dru pû atâo kma hlâm bông  
3pl village house go help take dead-person put in coffin  
‘People in the village go help to take a dead person put in the coffin.’

The second type of SVCs (the modifying SVC) will show another status of verbal sequence, where the verbs aren’t equal: one will be a modifier for others and that verb won’t contribute to lexical content of the construction. The changed status verb becomes a so-called case marker in a sentence in some case-marker languages. This change per se makes higher integration for this type of SVCs than the previous one in Ede.

(3) Amî kâo mña abân, kpin pioh chí brei kô arâng  
Mother 1sg weave blanket, skirt for sell give to 3pl  
‘My mother weaves blankets, skirts for selling to people.’

‘Brei’ in the above example has no contribution to lexical content of the construction. Its verbal status is different from example (4) in which it is the main verb. It modifies other verbs by a dative maker function.

(4) Käo brei kô ñu sa bê giê chíh  
1sg give to 3sg one CLF pen write  
‘I give him one pen.’

Three distinct types of SVC can be distinguished in Ede according to the degree of syntactic integration. The core SVC is the least integrated, the nuclear is a higher integrated construction while the modifying SVC is the highest one.
